# **pysds011**

*Release 0.0.3*

**Michele Pagot**

**Jan 19, 2021**

**CONTENTS:**

**1 Overview 1**

1.1 Installation . . . . . 1

1.2 Usage . . . . . 1

1.3 Documentation . . . . . 2

1.4 Development . . . . . 2

**2 Installation 3**

**3 Usage 5**

3.1 Use the package in a python script . . . . . 5

3.2 Use the command line tool . . . . . 6

**4 API documentation 9**

4.1 Driver API . . . . . 9

4.2 CLI app API . . . . . 10

**5 Authors 11**

**6 Changelog 13**

6.1 0.0.3 (2021-1-8) . . . . . 13

6.2 0.0.2 (2021-1-4) . . . . . 13

6.3 0.0.1 (2020-12-19) . . . . . 13

**7 Indices and tables 15**

**Python Module Index 17**

**Index 19**

## OVERVIEW

Simple python driver for SDS011 PM sensor from Nova.

- Free software: MIT license

### 1.1 Installation

```
pip install pysds011
```

You can also install the in-development version with:

```
pip install https://github.com/michelepagot/pysds011/archive/master.zip
```

### 1.2 Usage

Package has a class interface

```
log = logging.getLogger(__name__)
ser = serial.Serial('/dev/ttyUSB0', 9600)
ser.open()
sd = driver.SDS011(ser, log)
sd.cmd_set_sleep(0)
sd.cmd_set_mode(sd.MODE_QUERY)
sd.cmd_firmware_ver()
```

Package is also provided with a reference cli application:

```
pysds011.exe --port COM42 version
>> 21.2.2223
```

## 1.3 Documentation

This internal package documentation is available at <https://pysds011.readthedocs.io/> Some other interesting reading are: \* SDS011 datasheet <http://cl.ly/ekot> \* This project is inspired by <https://gist.github.com/kadamski/92653913a53baf9dd1a8>

## 1.4 Development

This repo just decide to adopt git flow strategy ...

## INSTALLATION

At the command line:

```
pip install pysds011
```

## 3.1 Use the package in a python script

To use pysds011 in a project, start by importing this package:

```
import pysds011
```

Provide an UART channel, user is in charge to also open/close it:

```
import serial

ser = serial.Serial('/dev/ttyUSB0', 9600)
ser.open()
```

Provide a logger:

```
import logging

log = logging.getLogger(__name__)
```

Now create a driver instance, injecting serial and logging:

```
sd = driver.SDS011(ser, log)
```

Usually the first step is to wake up the sensor:

```
sd.cmd_set_sleep(0)
```

Then start to interact with it:

```
sd.cmd_set_mode(sd.MODE_QUERY)
fw_ver = sd.cmd_firmware_ver()
dust_data = sd.cmd_query_data()
```

## 3.2 Use the command line tool

This package is provided with a command line tool to be able to immediately start playing with your sensor Command line is named `pysds011`

First stop should be the embedded help. Here just an outdated version of it:

```
pysds011.exe --help

Usage: pysds011 [OPTIONS] COMMAND [ARGS]...
  pysds011 cli app entry point

Options:
  --port TEXT          UART port to communicate with dust sensor.
  -v, --verbosity LVL  Either CRITICAL, ERROR, WARNING, INFO or DEBUG
  --help              Show this message and exit.

Commands:
  dust          Get dust value
  fw-version    Get SDS011 FW version
  help          Get specific help of a command
  sleep         Set sleep MODE 1:sleep 0:wakeup
```

And each command has its own help:

```
pysds011.exe help dust

Usage: pysds011 help [OPTIONS]

Get dust value

Options:
  --warmup INTEGER  Time in sec to warm up the sensor
  --format TEXT      result format (PRETTY|JSON|PM2.5|PM10)
  --help            Show this message and exit.
```

*Nova SDS011* sensor is connected to your machine through UART, so to read the actual dust value, you need to provide a **port** value:

```
pysds011.exe --port COM4 dust

PM 2.5: 25.9 g/m^3  PM 10: 62.4 g/m^3 CRC=OK
```

Dust value can be presented in **multiple format**:

- PRETTY (default)
- JSON:

```
pysds011.exe --port COM4 dust --format JSON
{'pm25': 28.4, 'pm10': 118.6, 'pretty': 'PM 2.5: 28.4 g/m^3  PM 10: 118.6 g/m^3,
↵CRC=OK'}
```

- Single PM:

```
pysds011.exe --port COM4 dust --format PM2.5
26.0
```

(continues on next page)

(continued from previous page)

```
pysds011.exe --port COM4 dust --format PM10
99.0
```

Read the dust sensor FW version:

```
pysds011.exe --port COM4 fw-version

FW version Y: 18, M: 11, D: 16, ID: 0xe748, CRC=OK
```

## API DOCUMENTATION

---

pysds011	
<i>pysds011.driver</i>	
<i>pysds011.cli</i>	Module that contains the command line app.

---

### 4.1 Driver API

Low level layer that is in charge to manage communication with the sensor. This is the most reusable part of this package

**class** `pysds011.driver.SDS011` (*ser, log*)

Main driver class

**cmd\_firmware\_ver** (*id=b'\xff\xff'*)

Get FW version

**Returns** version description dictionary

**Return type** dict

**cmd\_get\_mode** (*id=b'\xff\xff'*)

Get active reporting mode

**Parameters** *id* (2 bytes, optional) – sensor id to request mode, defaults to b'ÿÿ' that is 'all'

**Returns** mode if it is ok, None if error

**Return type** int

**cmd\_get\_sleep** ()

Get active sleep mode

**Returns** True if it is sleeping

**Return type** bool

**cmd\_get\_working\_period** (*id=b'\xff\xff'*)

Get current working period

**Returns** working period in minutes: work 30 seconds and sleep n\*60-30 seconds

**Return type** int

**cmd\_set\_id** (*id, new\_id*)

Set a device ID to a specific sensor

**Parameters**

- **id** (*2 bytes*) – ID of sensor that need a new ID (FF FF is in theory allowed too, but be carefull)
- **new\_id** (*2 bytes*) – new ID to be assigned

**Returns** operation result**Return type** bool**cmd\_set\_mode** (*mode=1, id=b'\xff\xff'*)

Set data reporting mode. The setting is still effective after power off

**Parameters**

- **mode** (*int, optional*) – 0:report active mode 1:Report query mode, defaults to 1
- **id** (*2 bytes, optional*) – sensor id to request mode, defaults to b'ÿÿ' that is 'all'

**Returns** True is set is ok**Return type** bool**cmd\_set\_sleep** (*sleep=1, id=b'\xff\xff'*)

Set sleep mode

**Parameters**

- **sleep** (*int, optional*) – 1:enable sleep mode, 0:wakeup, defaults to 1
- **id** (*2 bytes, optional*) – sensor id to request mode, defaults to b'ÿÿ' that is 'all'

**Returns** True is set is ok**Return type** bool**cmd\_set\_working\_period** (*period=0, id=b'\xff\xff'*)**Set working period** The setting is still effective after power off, factory default is continuous measurement. The sensor works periodically and reports the latest data.**Parameters** **period** (*int*) – 0:continuous(default), 1-30 minute work 30 seconds and sleep n\*60-30 seconds**Returns** result**Return type** bool

## 4.2 CLI app API

Module that contains the command line app.

## AUTHORS

- Michele Pagot - <https://michelepagot.github.io/>

## CHANGELOG

### 6.1 0.0.3 (2021-1-8)

- cli get subcommands and produce meaningful results
- robustness about error handling
- Testing and documentation

### 6.2 0.0.2 (2021-1-4)

- Improved cli (first functional).

### 6.3 0.0.1 (2020-12-19)

- First release on PyPI.
